Introduction

Purpose & description

The application referenced in this report is a REACT-based, client-side web application for searching through and rating Australian rental properties from an exposed REST API. Specifically, the application allows users to search through a list of >6000 rentals through a table structure that facilitates advanced filtering based on attributes such as state, postcode, maximum rent, etc. Users can click on rows in the table to enter a more detailed page about each individual property. Users can also log into the app to allow them to rate each property on a scale of one to five, as well as see a list of the properties that they have previously rated

On top of this, the application also has additional functionality including:

- Infinite scrolling on both the properties table and the list of previously rated properties
- Interactive map module built into the properties page
- Utilised Material UI (MUI) to style the application and keep layout and look consistent
- Added some basic checks to ensure a user's registered email address and password are valid

Completeness and Limitations

All required pages of the application currently work sufficiently including the Rental Search, Property, Login, Register, Home, About, and Rated Properties pages. The application also currently supports the use of all endpoints throughout its design. In particular, all filtering methods allowed by the search endpoint can be used including multiple simultaneously.

In terms of incomplete functionality, there are some areas that should be improved. Most notably, navigating away from the Rental Search page and then returning causes all filters to be removed and the table to be reset which can be irritating when searching properties that share a particular filter. Additionally, although some consideration has been given to smaller screen sizes, the application is primarily designed for desktop monitors and so, may exhibit layout or formatting issues on smaller devices.

Application Design

Navigation and Layout

The design process for the pages first involved investigating similar pages online to get an idea on how general features should be laid out. From there, basic sketches were created to act as a general layout that could be referred to when building out the app. An example of these sketches is shown in Appendix A.

The resulting sitemap of the application is shown below (note the lock symbol represents a page that can only be accessed once logged in):

When the site is first loaded, the user is directed to the home page. This serves as an introduction, explaining the purpose of the website and providing a quick link to the Rental Search page so users can begin browsing immediately. A navigation bar is also present at the top of each page, enabling easy access to most sections of the application. The only exceptions to are the Property and Register pages which must be accessed from another page instead. However, both still include buttons for returning to the previous page, and retain the navigation bar for consistent navigation.

Usability and Quality of Design

The usability of the app is mostly what is expected of a modern website.

Organisation and navigation

The application is well organized and, for the most part, easy to navigate. Opening the application for the first time immediately places the user into the home page which gives the user information on what to expect for the site. The home page also has a button near the middle of the screen to bring the user to the rentals search page so that they can begin searching as quick as possible. All pages have a navigation bar accessible from the top of the page which allows the user to navigate to almost all pages near instantly, reducing the possibility of the user getting confused about where to find a particular page.

The main issue in regard to navigation, however, is that the state of the rental grid is not persistent. This results in the position of the grid, as well as all filters and sort methods, to be reset upon leaving and returning to the page. This is unideal as it means that the user must either re-enter their desired filters every time they use the page, or rely solely on opening new tabs for each property so that they never leave the Rental Search page,

Visual Design

The visual design of the application is what is to be expected in a modern website. MUI's components have made consistency in layout, colour, and text easy to achieve which ensures a familiar feel across the application. Only four main colours are used throughout the application, each of them picked using online palette tools (such as MUI's colour tool) to ensure that they are complementary. Grid components are used regularly to ensure each page has a structured design and card components are frequently used to give important sections focus and texture. These design factors make the website more familiar to users, allowing them to easily navigate and utilise the site's features.

Compatibility and Performance

Due to the site being entirely based within the REACT ecosystem, it is compatible with most modern devices capable of running REACT applications. Additionally, its small size and modest functionality make it generally performant for its required tasks. The main performance exceptions are that the interactive maps on the Property pages occasionally load tiles more slowly than the rest of the application, and the grid on the Rental Search page may also appear slightly after the page has otherwise finished loading.

Interactivity

The website also offers various means of showing opportunities for interactivity. Buttons and options that can be selected often either change colour or 'jump' in a familiar manner when hovered over to show users that they can be interacted with.

Accessibility

Below is the performance of the website against some of the most important accessibility criteria:

Provide a text equivalent for every non-text element – alternatives to images, symbols, scripts, graphical buttons, sounds, audio and video files and so on.

For this criterion, the application mostly passes. All images used have an alternative text defined and icons that are used to convey information have the 'aria-label' property assigned to them to allow screen readers to easily describe them. Decorative symbols that serve no informative purpose are hidden from screen readers by default in MUI.

Conversely, the accessibility of certain components such as the Select component for dropdown boxes and the Ratings component to easily see and rate properties is questionable. While MUI does provide information on how to make these components the most accessible, not all of them have been implemented due to time constraints.

Ensure that all information conveyed with color is also available without color, for example from context or markup.

The majority of the application can be used as normal without colour. The only concern for this criterion is that certain interactable items such as buttons and rows in the rental grid rely on changing the background colour when hovered over to notify intractability. Removing this feature could make it less clear whether these items can be interacted with.

Organize documents so they may be read without style sheets. For example, when an HTML document is rendered without associated style sheets, it must still be possible to read the document.

The website fails this criterion. While the information for all pages can load without any styling, the lack of styling causes the pages to be dominated by images and icons, which smother the textual information, causing the site to be borderline unusable.

Ensure that text equivalents are updated when dynamic content changes

The website passes this criterion as there are no instances where the content of a page changes without also updating any related text.

Avoid causing the screen to flicker.

While the low performance requirements of the website does mean that screen flickering is rare, the loading of interactive map parts can cause some sudden changes of light. However, this issue is infrequent and when it does occur, it is only upon initial load.

Use the clearest and simplest language appropriate for a site's content.

The website itself has a limited amount of text with most instances being short, to-the-point statements such as button labels or rental titles. The only contentious text for this criterion is the rental descriptions provided by the API as these may include confusing or misleading information.

For tables, identify row and column headers – clearly differentiated from the data.

Visually the column headers are clearly differentiated from the rest of the data due to having differing background colours and heavier font weights. Additionally, the AG Grid element that makes up the table is designed to include aria labels within it, allowing screen readers to differentiate between the data and headers.

Cultural Accessibility

Due to the non-controversial nature of the application, there is little concern to be had about the effect its contents may have on users from specific cultural backgrounds. Particularly, the site has no images of deceased Aboriginal or Torres Strait Islanders which can cause distress for some members of that diaspora. The only possible concern is that data retrieved from the rental database may include offensive or controversial information as it is not vetted by the website before display. However, this is unlikely as the agencies where this data is collected from likely also implement some checks into the potential cultural effects their property descriptions may have.

Technical Description

Architecture

The root level of the application contains most of the expected files of a REACT application such as *package.json*, *index.html*, etc. Within the *src* directory, *main.jsx* is the entry point for the application and handles the routing to all pages. *App.jsx* dictates the header, footer and body of the application as well as the contexts required for authentication and theming.

The *context* directory holds the context files that allow state variables for authentication to be accessible to child nodes without needing to pass them through props. The *assets* directory holds some of the non-code related files used in the visual style of the website such as images as well as the *theme.js* file that dictates the colours available to the rest of the application. There is also a top-level *components* directory that includes high level components such as the navigation bar as well as utility components such as the alert box.

The *pages* directory contains the bulk of the application. Its contents are split off into further directories that each represent a page in the application. Within each page's directory there is a main page file dedicated to the layout of that page as well as a *components* directory that includes other components used in the page. This *components* directory may also be split into further directories as required.

Test plan

Task	Expected Outcome	Result	Screenshots (Appendix B)
Scroll down in grid	Grid displays more data, giving infinite scrolling illusion	PASS	1
Click column header to sort by ascending order	Grid displays data in ascending order for that column	PASS	2
Click column header to sort by descending order	Grid displays data in descending order for that column	PASS	3
Select state in dropdown	Grid only displays data that shares the same state	PASS	4
Select multiple property types in dropdown	Grid only displays data that shares the same listed property types	PASS	5
Enter text in filter box	Grid only displays data that shares the text value displayed in the text fields	PASS	6
Enter non-number value in Postcode box	The value is not added to the text field and an error message appears saying that only numbers are allowed	PASS	7
Select a maximum and minimum rating	Grid only displays data that has an average rating between the minimum and maximum values	PASS	8
Enter a valid number into the maximum and minimum number fields	Grid only displays data that is between the minimum and maximum values displayed in the number fields	PASS	9
Enter a non-number value into the maximum and minimum number fields	Value not added to number field	PASS	N/A
Enter value in multiple fields	Grid only displays data that matches the conditions set by multiple filters	PASS	10
Click clear filters button	Clears all applied filters to the grid	PASS	N/A
Click register button with invalid details	User is unable to register and each box that has an invalid value now shows an error message	PASS	11
Click register button with valid details	User's account is created and they are sent back to the home page. A successful registration message appears and the "My Properties" page should be visible. The login button is now be a logout button	PASS	12
Click register button with details that are already used for an account	User is to register, and an error message should appears telling the user that an account with that information already exists	PASS	13
Click login button with invalid details	User is unable to login and each box that has an invalid value should show an error message	PASS	14
Click login button with valid details	User's is sent back to the home page. A successful login message appears and the "My Properties" page should be visible. The login button is now a logout button	PASS	15
Click logout button	User is logged out and all links to pages that require authentication are removed.	PASS	16
Click on row in grid	Navigate to that property's page	PASS	N/A

Click on card in “My Properties” page	Navigate to that property’s page	PASS	N/A
Click to rate a property while logged out	Error warning appears telling user to log in first	PASS	17
Click to rate a property while logged in	Success message appears saying user rated the property successfully. A small “Rated by you” message now shows underneath the rating	PASS	18

Difficulties / Exclusions / unresolved & persistent errors

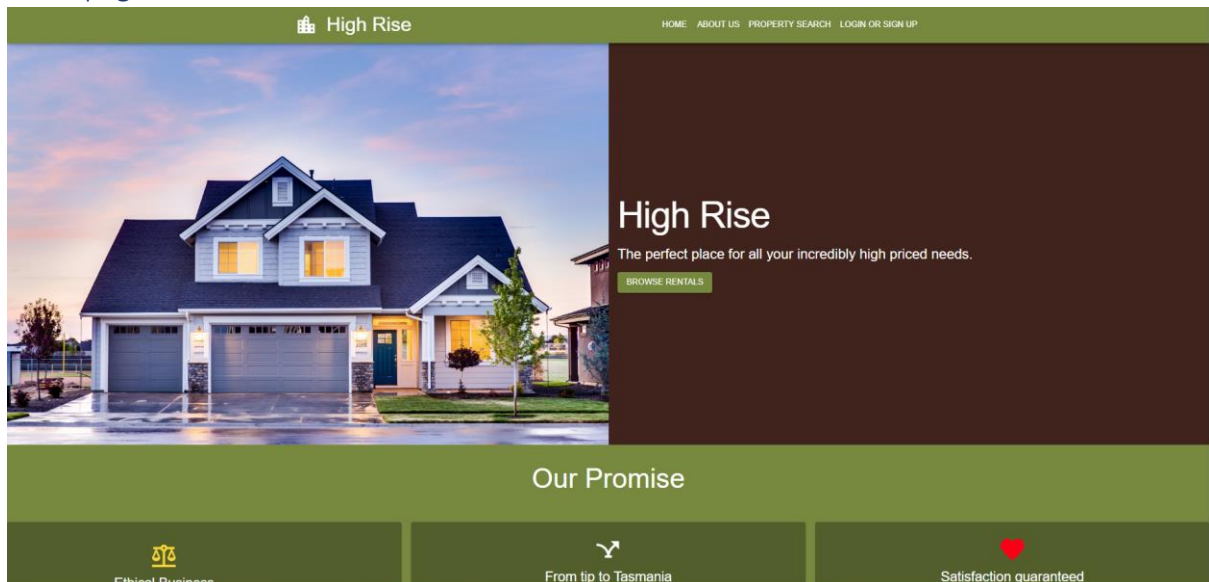

The largest issue faced in the creation of this application was implementing the infinite scroll functionality for the rental grid. Originally, MUI’s own table component, the MUI X Data Grid, was implemented for this task. While it integrated well with most of the other MUI components, it was difficult to implement infinite scrolling. While MUI X Data Grid does natively support infinite scrolling, it is exclusively reserved for the paid “Pro” plan. After trying to configure the component to work using roundabout methods, AG Grid was eventually chosen as a replacement which had a much easier process for implementing infinite scrolling.

In terms of functionality missing, the most notable example is the lack of the ability to persist filter options and selected properties in the rental grid so that they can be easily returned to after being navigated away from. This was unable to be completed due to time constraints.

While there are no direct bugs that have been found so far. The loading of the interactive map element and does show some flickering upon initial load which should be improved in future extensions.

User guide

Homepage

Initial page upon entering the website. Almost all other pages can be accessed from the navigation bar at the top of the screen. The browse rentals page in the centre brings the user directly to the Property Search page.

[REGISTER AND SIGN IN](#)

Already have an account? [SIGN IN](#)

The login and registration page allows users to login or register their account respectively. Only the login page is initially available from the navigation bar. However, switching to the register page from the login page can be done by pressing the “Sign Up” button at the bottom of the page. You can go back to the login page from the register page using a similar process. Both pages are very similar in layout, with the registration page having extra text fields for confirming email and password details. Logging in or registering will, if successful, bring the user back to the home page with a confirmation message on the bottom left of the screen. If it is not successful, you will instead get an error message in the bottom left of the screen detailing what went wrong.

Once logged in there will be two additional options in the navigation bar:

- **My Ratings:** Takes the user to the Ratings page.
- **Logout:** Has replaced the login button. Selecting it will bring the user back to the home page and reset the navigation bar to its original options.

WALK TO TOWN & SCHOOL	\$550	house	4570	Qld	Gympie	1	3	2	★★★★☆
Modern 4 Bedroom Townhouse Living at Greenview	\$2100	townhouse	2070	NSW	Lindfield	4	4	2	★★★★☆
Brand New 2 Bedroom Apartment	\$1600	apartment	2065	NSW	Crows Nest	2	2	1	★★★★☆
MODERN 2 BEDROOM APARTMENT WITH AN IDEAL LOCATION	\$510	apartment	2500	NSW	Wollongong	1	2	1	★★★★☆
Spacious modern two bedroom apartment!	\$1180	apartment	2113	NSW	Macquarie Park	2	2	1	★★★★☆

The bottom component is a table that displays some of the key data for the rentals. It has infinite scrolling functionality allowing the user to continuously scroll to find their desired property. Each column can be sorted both in ascending and descending order by selecting the column title. Selecting a row in the table will bring the user to that property's page. The title column specifically allows the user to open the property page in a new tab.

CLEAR FILTERS

The top component is an accordion that, when expanded, displays options to filter the table by. The available filtering options are:

- State: the state the property is in.
- Suburb: the suburb the property resides in.
- Postcode: the postcode of the property.
- Property types: the type of the property. Note that multiple types can be filtered through concurrently.
- Minimum and maximum rating: The minimum and maximum average rating for a property.
- Minimum and maximum rent: The minimum and maximum rent for a property.
- Minimum and maximum bedrooms: the minimum and maximum number of bedrooms in a property.
- Minimum and maximum bathrooms: the minimum and maximum number of bathrooms in a property.
- Minimum and maximum parking: the minimum and maximum number of parking spaces in a property.

There is also a button at the bottom of the component that clears all active filters, resetting the table to its non-filtered state.

Description

Welcome to 136/1B Sporting Drive — a stylish, fully air-conditioned waterfront retreat offering comfort and convenience in a secure, well-maintained complex. With stunning water views from the expansive undercover terrace, this fully furnished and mostly self-contained two-bedroom residence delivers effortless, move-in-ready living.

Inside, the home features a light-filled open-plan layout with plush carpeting in the living area and bedrooms. The modern kitchen is well-appointed with quality appliances, while an internal laundry, secure undercover parking and a separate storage unit complete this low-maintenance offering.

Property Features:

- Fully furnished and mostly self-contained
- Fully air-conditioned throughout
- Two spacious bedrooms with plush carpeting
- Well-appointed bathroom
- Modern kitchen with quality appliances
- Open-plan living and dining
- Large undercover terrace with water views

Page detailing the specifics about a specified property. Most of the page is just text but there are two main pieces of functionality.

1. The right (or bottom) of the page contains an interactive map element that allows the user to see the location of the property, as well as the area around it.
2. Near the top of the page is the rating for the property. If this is a property the user has rated in the past, the rating they gave the property will be shown along with a small message underneath it informing the user that they have rated it. If the user has not rated the property before, the average rating for the property will display instead.

The top left of the page has a back button that will lead the user to the page they were on before navigating to the property page.

Ratings Page / My Ratings Page

The ratings page displays high-level information about all the properties that the user has rated. It also has an infinite scroll feature implemented. Selecting any of the property cards will cause the user to be brought to that property's page.

Description

Set high within the well-regarded Waldorf Apartments, you'll enjoy an elevated lifestyle in one of Sydney CBD's most prestigious buildings. Positioned on a higher level, the apartment caters to those who desire a bright and airy living environment.

Designed for comfort and practicality, the spa balcony through expansive floor-to-ceiling sliding doors opens up the living area to the outdoors.

The updated kitchen is fitted with quality appl
everyday cooking and entertaining guests.

Both bedrooms are well-sized with built-in wardrobes. An internal laundry adds further convenience.

Residents enjoy secure entry, intercom access, and a variety of lifestyle facilities include a rooftop swimming pool, a lounge, and a gym.
